# Introduction

In New Zealand, sexually transmitted infections (STIs) are not notifiable therefore surveillance efforts rely upon laboratories and clinics voluntarily providing data. Laboratory surveillance of gonorrhoea began in the Auckland, Waikato and Bay of Plenty (BOP) regions in 1998. Laboratory surveillance of chlamydia began in the Waikato and BOP regions in 1998 and in the Auckland region in 2001. Since June 2004, efforts have been made to extend STI surveillance to additional laboratories across New Zealand.

This report presents data on chlamydia and gonorrhoea cases reported in the fourth quarter (October to December) 2009 from forty laboratories across New Zealand.

Quarterly reports of clinic-based surveillance are provided separately and are available at <u>www.surv.esr.cri.nz</u>.

All results and analyses are based on data submitted prior to the 9<sup>th</sup> January 2010. Any data submitted after this date is not included in this report due to time constraints. All results should be regarded as provisional.

## Methods

The participating laboratories (see Appendix A and B) report anonymised data on laboratory-confirmed cases of chlamydia and gonorrhoea, by age and sex. The diagnostic tests used by each laboratory differ.

An attempt has been made to de-duplicate the data where one patient may have multiple positive specimens. If this is not possible then it was assumed that each testpositive specimen was equivalent to one test-positive patient. As it is possible for one patient to have more than one positive specimen taken for the one STI episode, the true incidence may be less than that reported here.

#### STI Rates

Population-based disease rates for the quarter were calculated by dividing the total number of test-positive reported cases for chlamydia and gonorrhoea by the total 'usually resident' population data for the District Health Boards (DHBs). These rates have been annualised. Population data are Statistics New Zealand mid-year population estimates for Territorial Authorities in New Zealand. In contrast to reports prepared prior to April to June 2009, STI rates are not presented by the region.

The selection criteria for reporting a DHB is that all laboratories servicing that DHB participate in the surveillance programme (unless the missing laboratory(ies) is a hospital laboratory, and therefore presumed to undertake only small proportion of the DHB's STI testing). If a community laboratory undertakes testing for more than one DHB then those DHBs are reported together i.e. Auckland, Waitemata, and Counties Manukau DHBs (Labtests), and Hutt Valley and Capital Coast DHBs (Aotea Pathology).

#### Data completeness

Chlamydia data: Thirty nine laboratories provide chlamydia data for STI surveillance. All 39 laboratories submitted chlamydia data for the fourth quarter (October to December) 2009. The DHBs that met the inclusion criteria this quarter were Northland, Waitemata, Auckland, Counties Manukau, Waikato, Lakes, Bay of Plenty, Tairawhiti, Taranaki, Hawke's Bay, Whanganui, MidCentral, Wairarapa, West Coast, Otago and Southland. Excluded DHBs were Hutt, Capital & Coast, Nelson Marlborough, Canterbury and South Canterbury.

Gonorrhoea data: Thirty-two laboratories provide gonorrhoea data for STI surveillance. All 32 laboratories submitted gonorrhoea data for the fourth quarter (October to December) 2009. The DHBs that met the inclusion criteria this quarter were Northland, Waitemata, Auckland, Counties Manukau, Waikato, Lakes, Bay of Plenty, Tairawhiti, Taranaki, Hawke's Bay, Whanganui, MidCentral, Wairarapa, Hutt, Capital & Coast, West Coast, Otago and Southland. Excluded DHBs were Nelson Marlborough, Canterbury and South Canterbury.

Of all test-positive patient data submitted, 1.0% were of unknown age and 0.2% were of unknown sex.

# Chlamydia Results – October to December, 2009

#### **Chlamydia Incidence**

Table 1 presents the percentage of specimens tested for chlamydia that were positive, number of test-positive cases and annualised rates of chlamydia by DHB and sex. Annualised chlamydia rates by DHB are shown in Figure 1.

In the fourth quarter of 2009, a total of 6 337 cases of chlamydia were reported from 16 DHBs meeting the inclusion criteria. This represents a national annualised rate of 804 per 100 000 population. The national annualised female rate (1 161 per 100 000 population) was almost three times the annualised male rate (429 per 100 000 population). The highest overall annualised rate of chlamydia was reported for Tairawhiti DHB (1 273 per 100 000 population) followed by Hawke's Bay DHB (1 180 per 100 000 population).

Table 2 presents the number of test-positive cases and annualised rates of chlamydia by DHB and age group.

Seventy percent of all positive patients from the included DHBs were aged 15 to 24 years. The highest age-specific annualised rate of chlamydia occurred in the 20 to 24 years age group for males (2 076 per 100 000 population with 572 cases) and the 15 to 19 years age group for females (6 603 per 100 000 population with 1 958 cases).

Thirty-one (13 male, 18 female) cases of chlamydia were reported for the less than one year age group. The highest number of chlamydia cases aged less than one year was observed from Auckland, Waitemata and Counties Manukau DHBs (a total of 11 male and 10 female cases). Annualised rates by DHB could not be calculated separately for this age group, as estimated population data was not available.

# Gonorrhoea Results – October to December, 2009

#### **Gonorrhoea Incidence**

Table 3 presents the percentage of specimens tested for gonorrhoea that were positive, number of test-positive cases and annualised rates of gonorrhoea by DHB and sex. Annualised gonorrhoea rates by DHB are shown in Figure 2.

In the fourth quarter of 2009, a total of 505 cases of gonorrhoea were reported from 18 DHBs meeting the inclusion criteria. This represents a national annualised rate of 56 per 100 000 population. The national annualised male rate (62 per 100 000 population) was higher than the annualised female rate (51 per 100 000 population). The highest overall annualised rate of gonorrhoea was reported for Tairawhiti DHB (314 per 100 000 population) followed by Hawke's Bay DHB (123 per 100 000 population).

Table 4 presents the number of test-positive cases and annualised rates of gonorrhoea by DHB and age group.

Sixty-one percent of all positive patients from the included DHBs were aged 15 to 24 years. The highest age-specific annualised rate of gonorrhoea occurred in the 20 to 24 years age group for males (300 per 100 000 population with 95 cases) and the 15 to 19 years age group for females (260 per 100 000 population with 87 cases).

No cases were reported for the less than one year age group.
